

Python Basics – Advanced Practice Set (50 Questions)

Section 1: Output & Syntax Thinking

1. What will the following code print? `print('Hello' + 'World')`
2. Fix the error: `print('Hello World)`
3. Write a program to print Python is fun using a single `print()`.
4. What is the output? `print('5' * 3)`
5. Difference between `print('Hello', 'World')` and `print('Hello' + 'World')`
6. Print your name 5 times in one line.
7. Output of `print('Hello\nWorld\nPython')`
8. Identify the mistake: `print(Hello World)`
9. Print Name and Age using escape sequences.
10. What happens with `print('Hello' * -1)`?

Section 2: Variables & Data Types

11. Create variables: `city`, `temperature`, `is_raining`.
12. Type of `x = 10.0`?
13. Output of `x='10'; y=5; print(x + str(y))`
14. Fix: `age='25'; print(age + 5)`
15. Swap two variables.
16. Output: `a=5; b=a; a=10; print(b)`
17. Can variable start with `_`? Example.
18. Valid names: `1name`, `name_1`, `_name`, `name-1`
19. Store birth year and calculate age.
20. Output: `x=True; print(type(x))`

Section 3: Typecasting Mastery

21. Convert `'100'` to `int` and multiply by 2.
22. What happens: `int('abc')`?
23. Convert 5 to string and add ' apples'.
24. Output: `print(float(5))`
25. Convert `'3.14'` to `float` and add 1.
26. Fix: `print(int('10.5'))`

- 27. Output: `print(bool(""))`
- 28. Convert input to int and add 20.
- 29. Output: `print(bool('False'))`
- 30. Why does `int(True)` work?

Section 4: User Input Logic

- 31. Take name and print Welcome message.
- 32. Take age and print next year's age.
- 33. Take two numbers and print sum.
- 34. What's wrong: `num=input(); print(num+10)`
- 35. Take number and print double.
- 36. Take input and print type.
- 37. Take first and last name and print full name.
- 38. Even or odd check.
- 39. Square of number using typecasting.
- 40. Print: You entered

Section 5: Operators & Expressions

- 41. Output: `print(10/3)`
- 42. Output: `print(10//3)`
- 43. Output: `print(10%3)`
- 44. Area of rectangle.
- 45. Simple Interest formula.
- 46. Output: `print(2**3**2)`
- 47. Celsius to Fahrenheit.
- 48. Output: `print(5 + 2 * 3)`
- 49. Print larger of two numbers.
- 50. Average of 3 numbers.
